Crowner dentified by a combination of several methods: Gene prediction programs including Fgenesh (http://www.softberry.com/), genscan and Genescan+ (Chris Burge, http://crowner.com/). And Genescan+ (Chris Burge, http://crowner.com/). Genescan+ (Chris Burge, http://crowner.com/). And Genescan+ (Chris Burge, http://genemark.biology.gatech.edu/Genemark/), and Genesplicer (Mihaela Perrea and Steven Salzberg, contact mpertea@tigr.org/, complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgl.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes without significant peptide similarity but with EST similarity to other proteins are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Simple repeats are predictified by repeatmasker (Arian Smit, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are http://tp.genome.washington.edu/RW/RepeatMasker.html).

```
Counce were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur repm.orn.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html).

Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, that are predicted by sinilarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are predicted by tRNAscan-SE (Sean Eddy, the seas encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://ftp.genome.wasth.acu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, thtp://ftp.genome.wasthington.edu/RW/RepeatMasker.html). Regions of genomic sequence that are nonctated as genes but have predicted exons by GRAIL are annotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              join(<3627. .3661,3762. .3843,3918. .3995,4081. .4140,

                                                                                                                                                                                                                                                                                                                                                                  Similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RW/Repeatmasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  APGRCSRYVPGCEDREGOSGKEAYLVSHNLLNAHAEAVEVFROKVKGGKIGIAHSPAW

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (ftp://arthur.epm.orn.igov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/services/NetGenes/), searches of the complete sequence against a peptide database and plant EST databases at TIGR, and manual curations based on those analyses. Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by two or more gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy/tRNAscan-SE). Simple repeats were identified by repeatmasker (Arian Smit, http://ftp.genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats were numbered from the top to bottom of the chromosome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               We thank the CSHL/WashU/ABI consortium for sequencing BAC clones F6P23, F5J6, T17A5, and T13L16, the ESSA group for sequencing clone F13D4, and Scott Jackson, Jiming Jiang, Klaus Meyer, Eric Richards and Satoshi Tabate for helpful assistance. In addition, we would like to thank the TIGR Bioinformatics Department, especially Lixin Zhou, Hanif Khalak, Michael E. Heaney, Lily Fu, Feng Liang, Jeremy Peterson, Michael Holmes, and Delwood Richardson for software and database support.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LAFDYSLEMCIHLKKSAYLALIGNFLRSNELPKVIEVVKEMVKAQHSLGCYQGAMLIH

Assembly program: Phrap; version 0.960731
Consensus quality: 175387 bases at least Q40
Consensus quality: 184707 bases at least Q20
Insert size: 173000; agarose-fp
Insert size: 173000; agarose-fp
Insert size: 186216; sum-of-contigs
Quality coverage: 4.8 in Q20 bases.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 26 contigs. The true order of the pleces
* is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1324 14.23.23; Cont. 9 of 123 bp in length 11424 112572; Cont. 9 of 1149 bp in length 11573 12672; gap of 100 bp 12673 12672; gap of 100 bp 12673 14167; Cont. 9 of 1495 bp in length 14168 14267; gap of 100 bp 14268 15746; Cont. 9 of 1479 bp in length 15747 1546; Cont. 9 of 1570 bp in length 15847 17416; Cont. 9 of 1283 bp in length 17517 17516; gap of 100 bp 18990 20317; Cont. 9 of 1283 bp in length 18900 20317; Cont. 9 of 1418 bp in length 18900 20317; Cont. 9 of 100 bp 20418 22468 22567; Cont. 9 of 2050 bp in length 22468 22567; Cont. 9 of 3253 bp in length 22568 25620; Cont. 9 of 3253 bp in length 2258

United Submission

Submitted (13-DEC-2000) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerques/Esanger.ac.uk

On Dec 24, 2000 this sequence version replaced gi:11990033.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation amnotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated repeat sequence elements. Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw., SWISSPROT; Tr., TREMBL; WP:, WORMPEP: Information on the WORWEPEP database can be found at IMPORTANT: This sequence is not the entire insert of clone RP11-46B11 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP11-46B11 is at 1 in this sequence. The true left end of clone RP3-50BD13 is at 151987 in this sequence. The true right end of clone RP11-454P17 is at 95829 in this http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping seq_documentation_block: LOCUS AL355796 152086 bp DNA PRI 23-DEC-2000 DEFINITION Human DNA sequence from clone RP11-46B11 on chromosome 6, complete Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6 RPI1-46B11 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. For further details see Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo. 1 (bases 1 to 152086) http://www.chor1.org/bacpac/home.htm VECTOR: pBACe3.6 AL355796 AL355796.11 GI:11991379 Direct Submission Homo sapiens Almeida, J. sequence. sednence human. Genes with similarity to proteins in the databases are described
as 'putative', '-like' or 'similar to'. Genes that have EST
similarity but no significant protein similarity are described as
'unknown proteins'. Genes that are annotated based only on gene
prediction software are described as 'hypothetical proteins'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compblo.ornl.gov/sectlon/index.hhml), GensSchN (chris Burge,
http://gnomic.stanford.edu/-chris/GENSCANW html), Fexa (V.Solovyev
& A.Salamov, Sanger Centre, http://genomic.sanger.ac.uk/),
NetPlantGene (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/NetPlantGene.html) and
eMotifi(Nevill-Manning, C.G. Wu, T.D. & Brutlag, D.L.,
http://motif.stanford.edu/projects.html).

It currently consists of 14 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
